

Meta-Learning Recipe, Black-Box Adaptation, Optimization-Based Approaches

CS 330

Course Reminders

HW1 due Weds 10/9

First paper presentations & discussions on Wednesday!

Plan for Today

- Recap **probabilistic formulation** of meta-learning
 - **General recipe** of meta-learning algorithms
 - **Black-box adaptation** approaches
 - **Optimization-based** meta-learning
- } Topic of Homework 1!
- } Part of Homework 2

Recap from Last Time

learn *meta-parameters* θ : $p(\theta|\mathcal{D}_{\text{meta-train}})$

whatever we need to know about $\mathcal{D}_{\text{meta-train}}$ to solve new tasks

$$\mathcal{D}_{\text{meta-train}} = \{(\mathcal{D}_1^{\text{tr}}, \mathcal{D}_1^{\text{ts}}), \dots, (\mathcal{D}_n^{\text{tr}}, \mathcal{D}_n^{\text{ts}})\}$$

$$\mathcal{D}_i^{\text{tr}} = \{(x_1^i, y_1^i), \dots, (x_k^i, y_k^i)\}$$

meta-learning: $\theta^* = \arg \max_{\theta} \log p(\theta|\mathcal{D}_{\text{meta-train}})$

$$\mathcal{D}_i^{\text{ts}} = \{(x_1^i, y_1^i), \dots, (x_l^i, y_l^i)\}$$

adaptation: $\phi^* = \arg \max_{\phi} \log p(\phi|\mathcal{D}^{\text{tr}}, \theta^*)$

$$\phi^* = f_{\theta^*}(\mathcal{D}^{\text{tr}})$$

$$\text{meta-learning: } \theta^* = \max_{\theta} \sum_{i=1}^n \log p(\phi_i|\mathcal{D}_i^{\text{ts}})$$

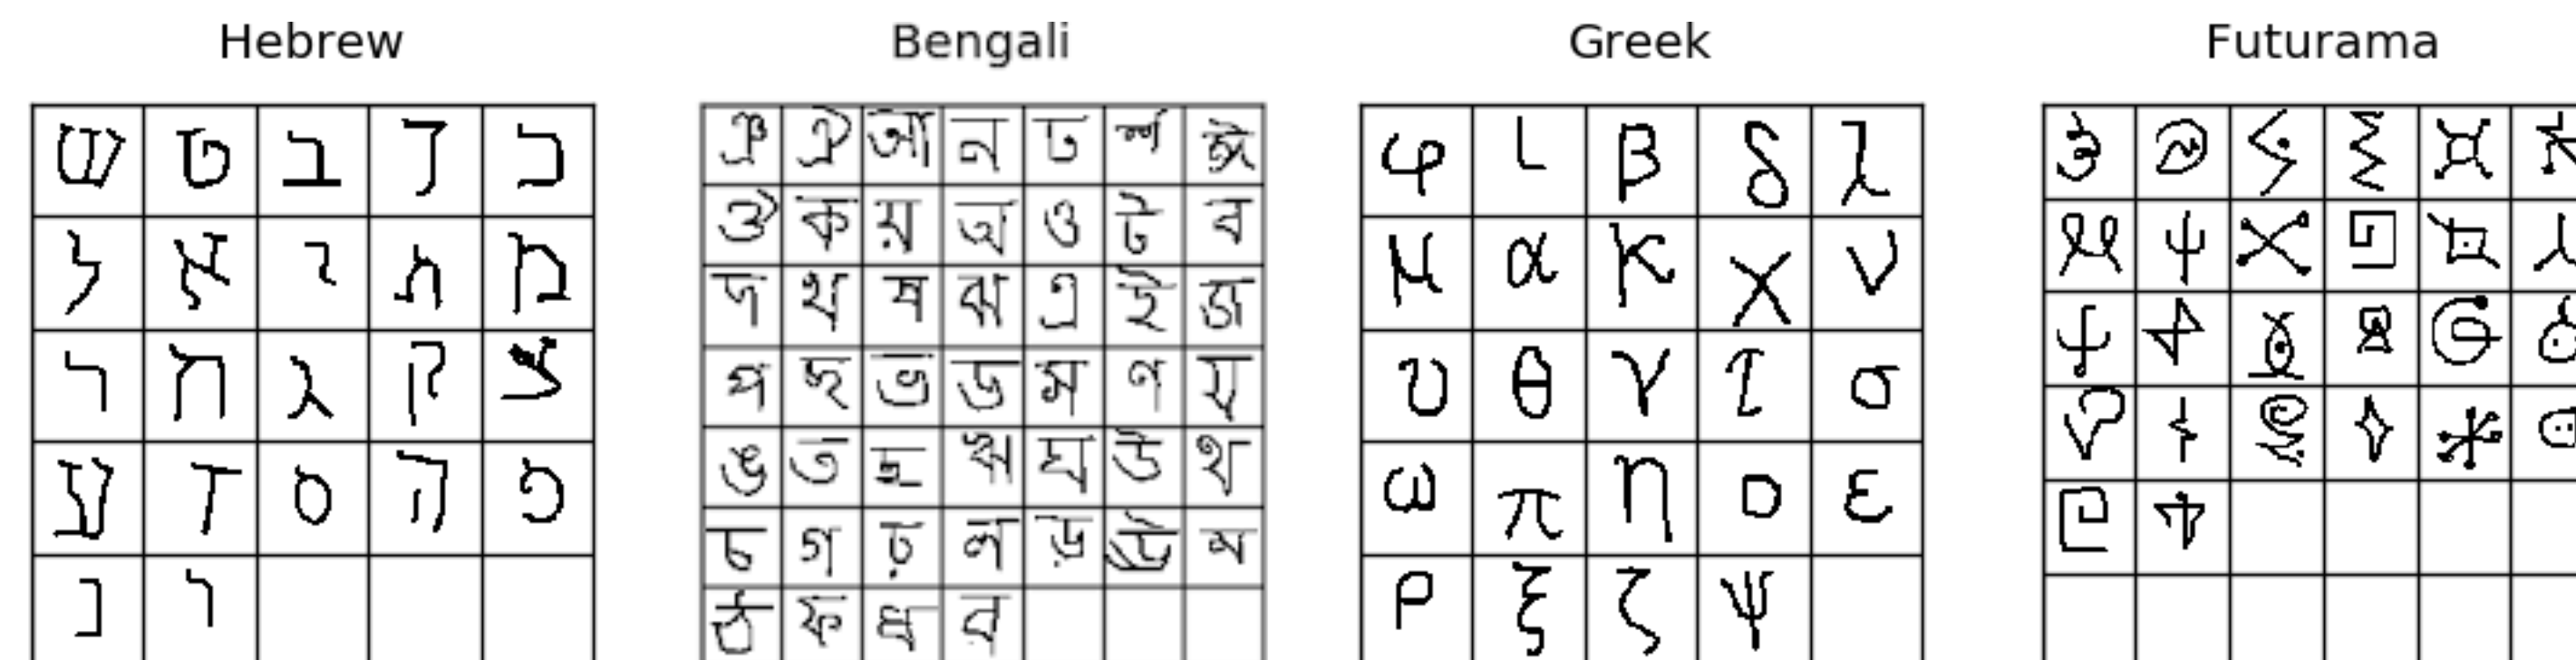

$$\text{where } \phi_i = f_{\theta}(\mathcal{D}_i^{\text{tr}})$$

General recipe

How to *evaluate* a meta-learning algorithm

the Omniglot dataset Lake et al. Science 2015

1623 characters from 50 different alphabets

many classes, few examples

the “transpose” of MNIST

statistics more reflective
of the real world

20 instances of each character

Proposes both **few-shot discriminative** & **few-shot generative** problems

Initial few-shot learning approaches w/ **Bayesian models, non-parametrics**

Fei-Fei et al. ‘03 Lake et al. ‘11 Salakhutdinov et al. ‘12 Lake et al. ‘13

Other datasets used for **few-shot image recognition**: Minilmagenet, CIFAR, CUB, CelebA, others

General recipe

How to *evaluate* a meta-learning algorithm

5-way, 1-shot image classification (Minilmagenet)

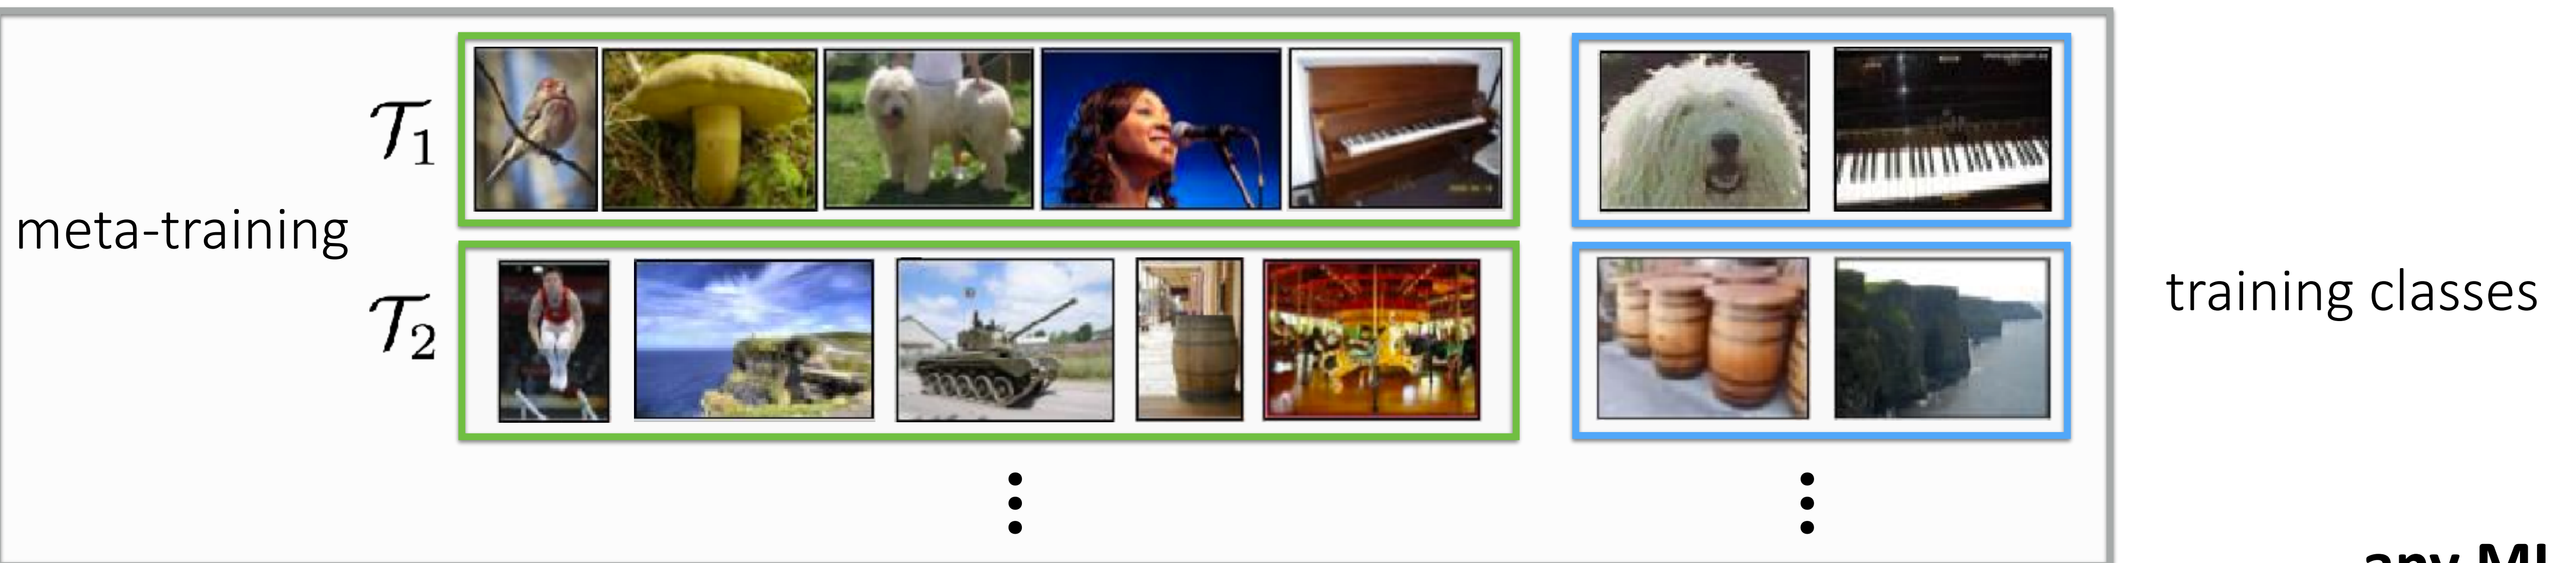

Given 1 example of 5 classes:

Classify new examples

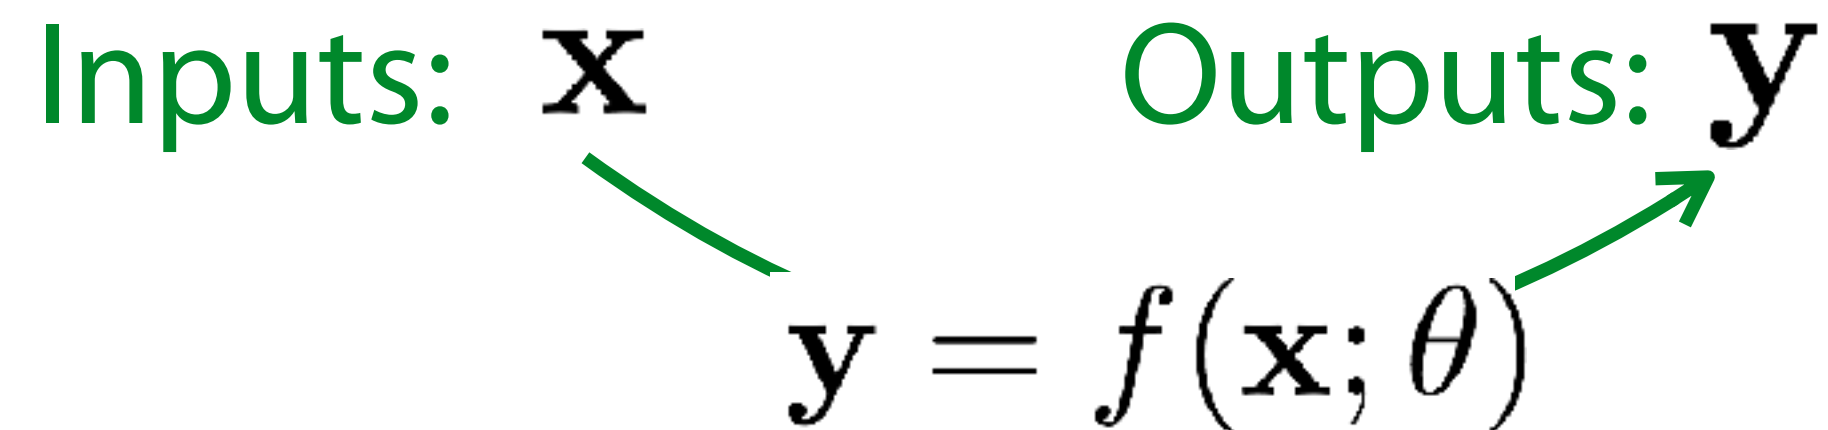

held-out classes

Can replace image classification with: regression, language generation, skill learning, **any ML problem**

The Meta-Learning Problem: The **Mechanistic** View

Supervised Learning:

Data: $\mathcal{D} = \{(\mathbf{x}, \mathbf{y})_i\}$

Meta-Supervised Learning:

Data: $\mathcal{D}_{\text{meta-train}} = \{\mathcal{D}_i\}$

$\mathcal{D}_i : \{(\mathbf{x}, \mathbf{y})_j\}$

Why is this view useful?

Reduces the problem to the design & optimization of f .

The Meta-Learning Problem: The Probabilistic View

Supervised Learning:

Data: $\mathcal{D} = \{(\mathbf{x}, \mathbf{y})_i\}$

As inference: $p(\theta | \mathcal{D})$

Meta-Supervised Learning:

Data: $\mathcal{D}_{\text{meta-train}} = \{\mathcal{D}_i\}$

$\mathcal{D}_i : \{(\mathbf{x}, \mathbf{y})_j\}$

As inference: $p(\phi_i | \mathcal{D}_i^{\text{tr}}, \theta)$

$$\max_{\theta} \sum_i \log p(\phi_i | \mathcal{D}_i^{\text{ts}})$$

General recipe

How to *design* a meta-learning algorithm

1. Choose a form of $p(\phi_i | \mathcal{D}_i^{\text{tr}}, \theta)$
2. Choose how to optimize θ w.r.t. max-likelihood objective using $\mathcal{D}_{\text{meta-train}}$

Can we treat $p(\phi_i | \mathcal{D}_i^{\text{tr}}, \theta)$ as an **inference** problem?

Neural networks are good at inference.

Plan for Today

- Recap **probabilistic formulation** of meta-learning
 - **General recipe** of meta-learning algorithms
 - **Black-box adaptation approaches**
 - **Optimization-based** meta-learning
- } Topic of Homework 1!
- } Part of Homework 2

Black-Box Adaptation

Key idea: Train a neural network to represent $p(\phi_i | \mathcal{D}_i^{\text{tr}}, \theta)$

For now: Use deterministic (point estimate) $\phi_i = f_\theta(\mathcal{D}_i^{\text{tr}})$

(Bayes will come back later)

Train with standard supervised learning!

$$\max_{\theta} \sum_{\mathcal{T}_i} \underbrace{\sum_{(x,y) \sim \mathcal{D}_i^{\text{test}}} \log g_{\phi_i}(y|x)}_{\mathcal{L}(\phi_i, \mathcal{D}_i^{\text{test}})}$$

$$\max_{\theta} \sum_{\mathcal{T}_i} \mathcal{L}(f_{\theta}(\mathcal{D}_i^{\text{tr}}), \mathcal{D}_i^{\text{test}})$$

Black-Box Adaptation

Key idea: Train a neural network to represent $p(\phi_i | \mathcal{D}_i^{\text{tr}}, \theta)$

1. Sample task \mathcal{T}_i (or mini batch of tasks)
2. Sample disjoint datasets $\mathcal{D}_i^{\text{tr}}, \mathcal{D}_i^{\text{test}}$ from \mathcal{D}_i

Black-Box Adaptation

Key idea: Train a neural network to represent $p(\phi_i | \mathcal{D}_i^{\text{tr}}, \theta)$

1. Sample task \mathcal{T}_i (or mini batch of tasks)
2. Sample disjoint datasets $\mathcal{D}_i^{\text{tr}}, \mathcal{D}_i^{\text{test}}$ from \mathcal{D}_i
3. Compute $\phi_i \leftarrow f_\theta(\mathcal{D}_i^{\text{tr}})$
4. Update θ using $\nabla_\theta \mathcal{L}(\phi_i, \mathcal{D}_i^{\text{test}})$

Black-Box Adaptation

Key idea: Train a neural network to represent $p(\phi_i | \mathcal{D}_i^{\text{tr}}, \theta)$

Challenge

Outputting all neural net parameters does not seem scalable?

Idea: Do not need to output **all** parameters of neural net, only sufficient statistics
(Santoro et al. MANN, Mishra et al. SNAIL)

low-dimensional vector h_i
represents contextual task information

$$\phi_i = \{h_i, \theta_g\}$$

recall:

$$\text{general form: } y^{\text{ts}} = f_\theta(\mathcal{D}_i^{\text{tr}}, x^{\text{ts}})$$

What architecture should we use for f_θ ?

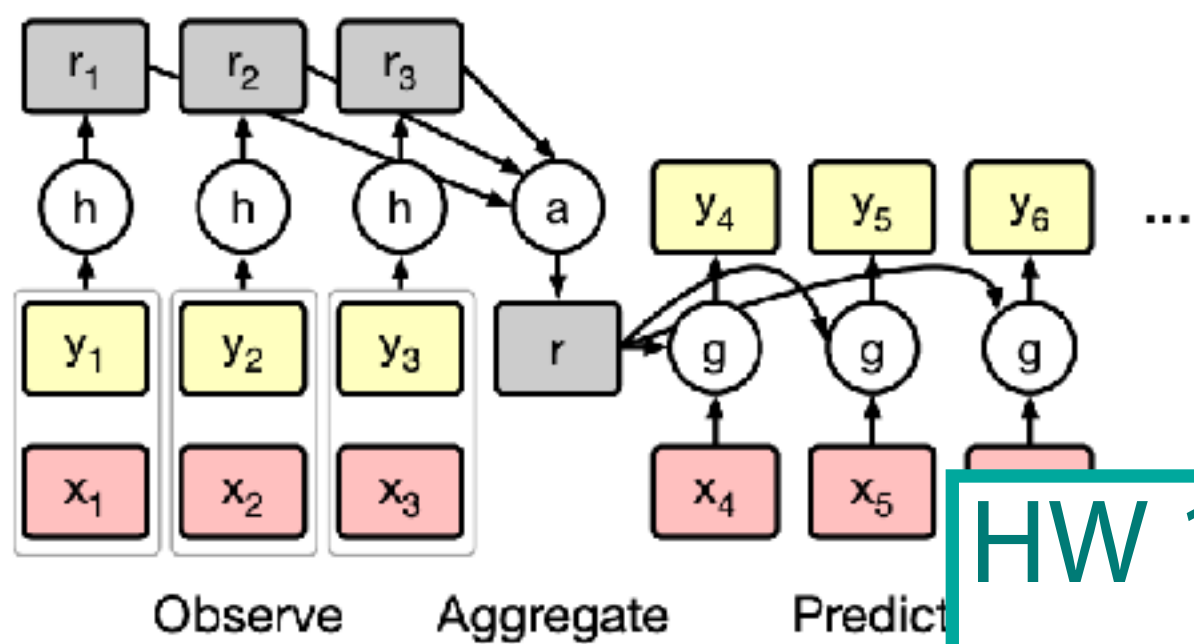

Black-Box Adaptation

LSTMs or Neural turing machine (NTM)

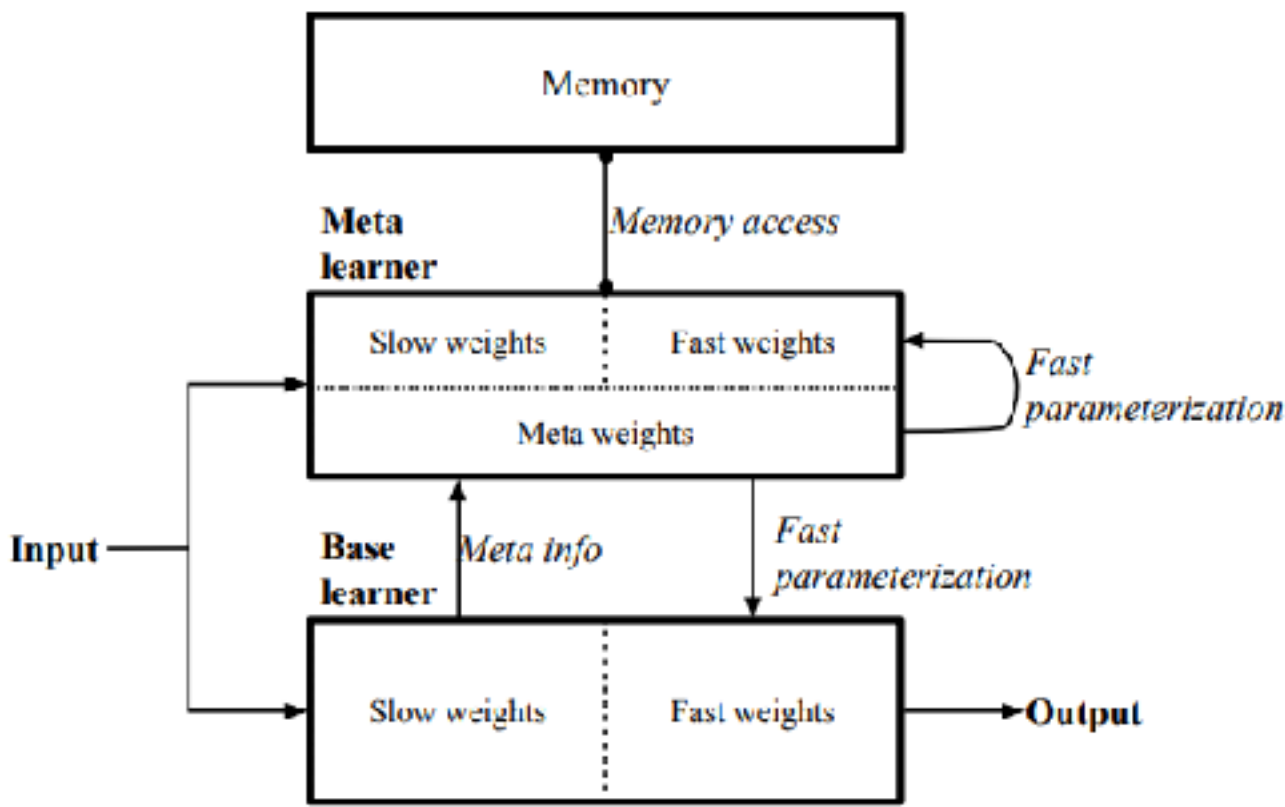

Meta-Learning with Memory-Augmented Neural Networks
Santoro, Bartunov, Botvinick, Wierstra, Lillicrap. ICML '16

Feedforward + average

Conditional Neural Processes. Garnelo, Rose, Ramalho, Saxton, Shanahan, Teh, Rezende, B

Other external memory mechanisms

Meta Networks
Munkhdalai, Yu. ICML '17

Method	5-Way Omniglot		20-Way Omniglot	
	1-shot	5-shot	1-shot	5-shot
SNAIL, Ours	99.07% ± 0.16%	99.78% ± 0.09%	97.64% ± 0.30%	99.36% ± 0.18%

Convolutions & attention

A Simple Neural Attentive Meta-Learner
Mishra, Rohaninejad, Chen, Abbeel. ICLR '18

5-Way Mini-ImageNet	
1-shot	5-shot
± 0.99%	68.88% ± 0.92%

HW 1:

- implement data processing
- implement simple black-box meta-learner
- train few-shot Omniglot classifier

Black-Box Adaptation

Key idea: Train a neural network to represent $p(\phi_i | \mathcal{D}_i^{\text{tr}}, \theta)$

+ **expressive**

+ easy to combine with **variety of learning problems** (e.g. SL, RL)

- **complex model w/ complex task: challenging optimization** problem

- often **data-inefficient**

How else can we represent $p(\phi_i | \mathcal{D}_i^{\text{tr}}, \theta)$?

Is there a way to infer **all parameters** in a scalable way?

What if we treat it as an **optimization** procedure?

Plan for Today

- Recap **probabilistic formulation** of meta-learning
 - **General recipe** of meta-learning algorithms
 - **Black-box** adaptation approaches
 - **Optimization-based meta-learning**
- } Topic of Homework 1!
- } Part of Homework 2

Optimization-Based Inference

Key idea: Acquire ϕ_i through optimization.

$$\max_{\phi_i} \log p(\mathcal{D}_i^{\text{tr}} | \phi_i) + \log p(\phi_i | \theta)$$

Meta-parameters θ serve as a prior. What form of prior?

One successful form of prior knowledge: **initialization** for **fine-tuning**

Optimization-Based Inference

Fine-tuning

$$\phi \leftarrow \theta - \alpha \nabla_{\theta} \mathcal{L}(\theta, \mathcal{D}^{\text{tr}})$$

pre-trained parameters

training data for new task

(typically for many gradient steps)

Pre-trained Dataset	PASCAL	SUN
Original	58.3	52.2
Random	41.3 [21]	35.7 [2]

What makes ImageNet good for transfer learning? Huh, Agrawal, Efros. '16

Where do you get the pre-trained parameters?

- ImageNet classification
- Models trained on large language corpora (BERT, LMs)
- Other unsupervised learning techniques
- Whatever large, diverse dataset you might have

Pre-trained models often available online.

Some common practices

- Fine-tune with a smaller learning rate
- Lower learning rate for lower layers
- Freeze earlier layers, gradually unfreeze
- Reinitialize last layer
- Search over hyperparameters via cross-val
- Architecture choices matter (e.g. ResNets)

Optimization-Based Inference

Fine-tuning

$$\phi \leftarrow \theta - \alpha \nabla_{\theta} \mathcal{L}(\theta, \mathcal{D}^{\text{tr}})$$

pre-trained parameters

training data for new task

(typically for many gradient steps)

Universal Language Model Fine-Tuning for Text Classification. Howard, Ruder. '18

Figure 3: Validation error rates for supervised and semi-supervised ULMFiT vs. training from scratch with different numbers of training examples on IMDB, TREC-6, and AG (from left to right).

Fine-tuning less effective with very small datasets.

Optimization-Based Inference

Fine-tuning

[test-time]

$$\phi \leftarrow \theta - \alpha \nabla_{\theta} \mathcal{L}(\theta, \mathcal{D}^{\text{tr}})$$

pre-trained parameters

training data for new task

Meta-learning

$$\min_{\theta} \sum_{\text{task } i} \mathcal{L}(\theta - \alpha \nabla_{\theta} \mathcal{L}(\theta, \mathcal{D}_i^{\text{tr}}), \mathcal{D}_i^{\text{ts}})$$

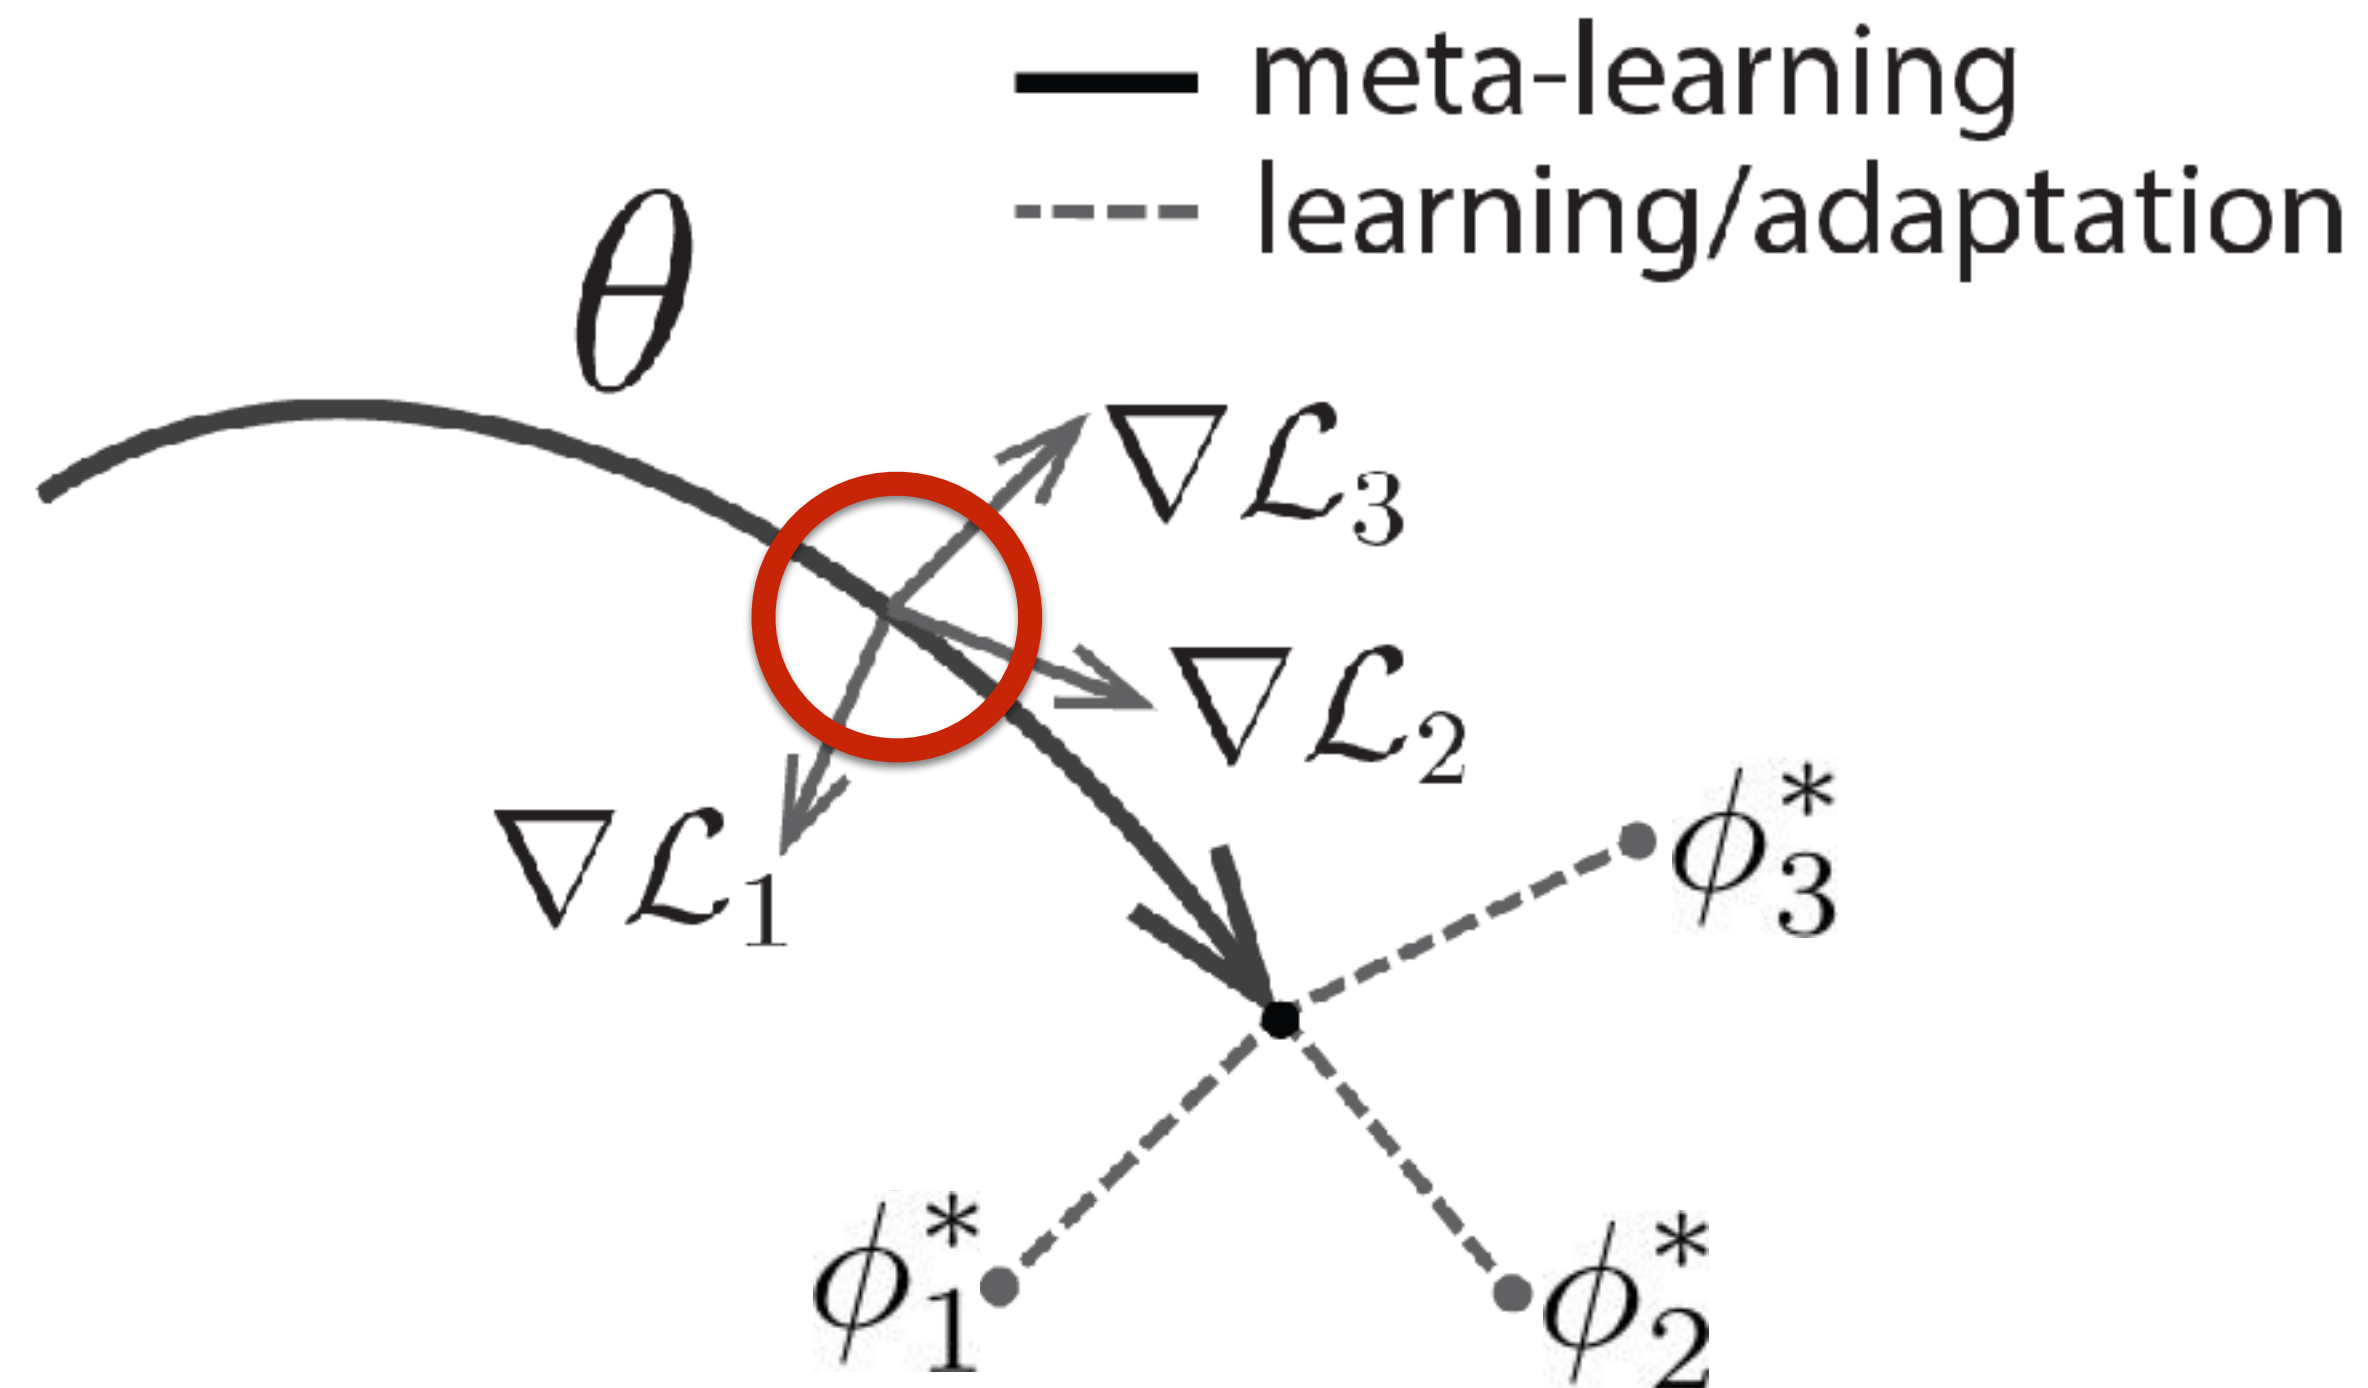

Key idea: Over many tasks, learn parameter vector θ that transfers via fine-tuning

Optimization-Based Inference

$$\min_{\theta} \sum_{\text{task } i} \mathcal{L}(\theta - \alpha \nabla_{\theta} \mathcal{L}(\theta, \mathcal{D}_i^{\text{tr}}), \mathcal{D}_i^{\text{ts}})$$

θ parameter vector
being meta-learned

ϕ_i^* optimal parameter
vector for task i

Model-Agnostic Meta-Learning

Optimization-Based Inference

Key idea: Acquire ϕ_i through optimization.

General Algorithm:

~~Amortized approach~~ Optimization-based approach

1. Sample task \mathcal{T}_i (*or mini batch of tasks*)
2. Sample disjoint datasets $\mathcal{D}_i^{\text{tr}}, \mathcal{D}_i^{\text{test}}$ from \mathcal{D}_i
3. ~~Compute $\phi_i \leftarrow f_{\theta}(\mathcal{D}_i^{\text{tr}})$~~ Optimize $\phi_i \leftarrow \theta - \alpha \nabla_{\theta} \mathcal{L}(\theta, \mathcal{D}_i^{\text{tr}})$
4. Update θ using $\nabla_{\theta} \mathcal{L}(\phi_i, \mathcal{D}_i^{\text{test}})$

—> brings up **second-order** derivatives

Do we need to compute the full Hessian? 🤖

-> whiteboard

Do we get higher-order derivatives with more inner gradient steps?

Optimization vs. Black-Box Adaptation

Black-box adaptation

general form: $y^{\text{ts}} = f_{\theta}(\mathcal{D}_i^{\text{tr}}, x^{\text{ts}})$

Model-agnostic meta-learning

$$\begin{aligned} y^{\text{ts}} &= f_{\text{MAML}}(\mathcal{D}_i^{\text{tr}}, x^{\text{ts}}) \\ &= f_{\phi_i}(x^{\text{ts}}) \end{aligned}$$

$$\text{where } \phi_i = \theta - \alpha \nabla_{\theta} \mathcal{L}(\theta, \mathcal{D}_i^{\text{tr}})$$

MAML can be viewed as **computation graph**,
with embedded gradient operator

Note: Can mix & match components of computation graph

Learn initialization but replace gradient update with learned network

$$\begin{aligned} \text{where } \phi_i &= \theta - \alpha \cancel{\nabla_{\theta} \mathcal{L}(\theta, \mathcal{D}_i^{\text{tr}})} \\ &\quad f(\theta, \mathcal{D}_i^{\text{tr}}, \nabla_{\theta} \mathcal{L}) \end{aligned}$$

Ravi & Larochelle ICLR '17

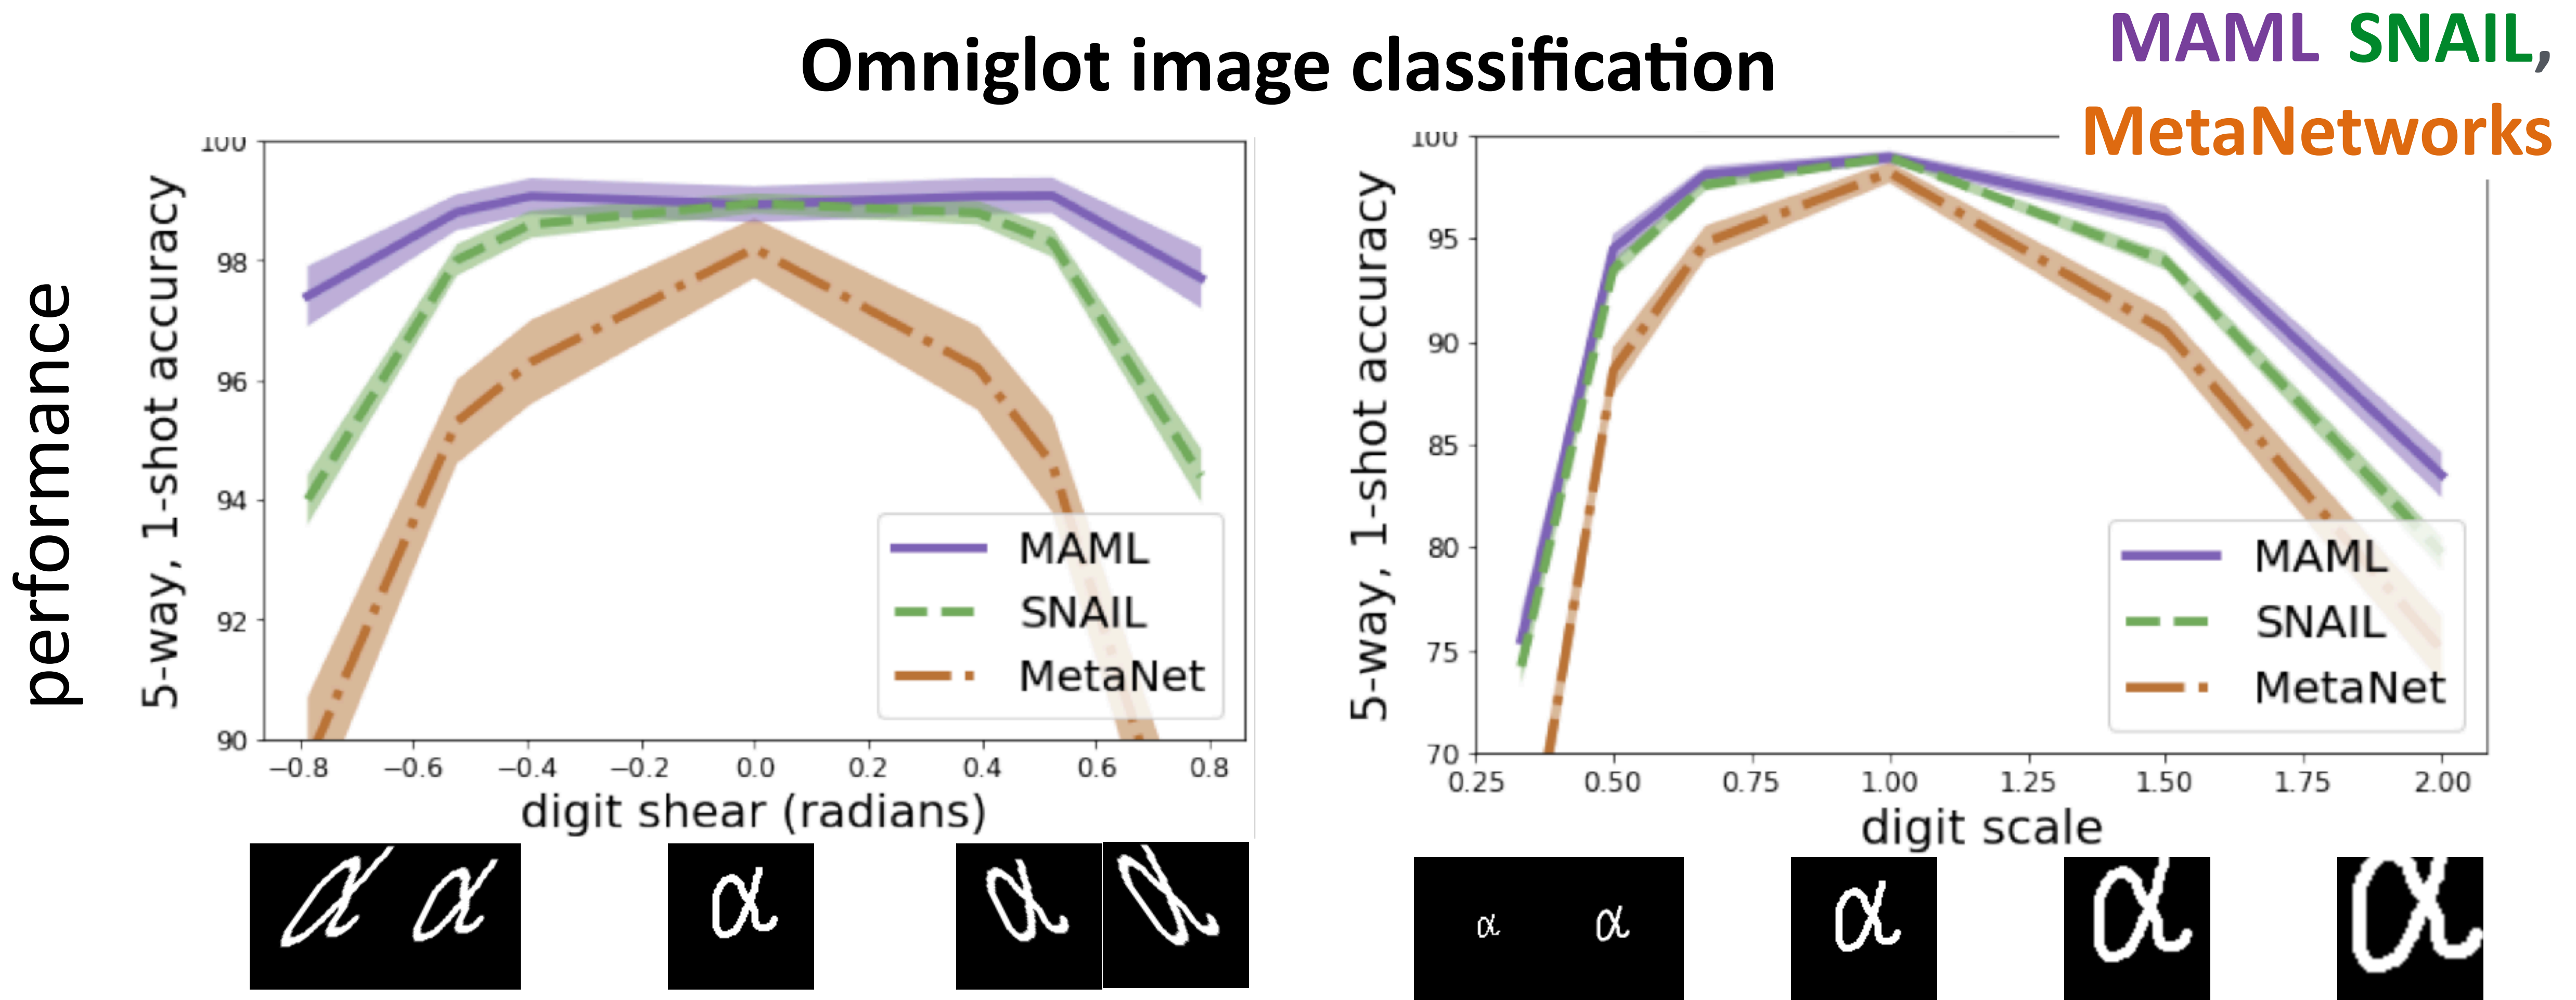

(actually precedes MAML)

This **computation graph view** of meta-learning will come back again!

Optimization vs. Black-Box Adaptation

How well can learning procedures generalize to similar, but extrapolated tasks?

Omniglot image classification

Does this structure come at a cost?

Black-box adaptation

$$y^{\text{ts}} = f_{\theta}(\mathcal{D}_i^{\text{tr}}, x^{\text{ts}})$$

Optimization-based (MAML)

$$y^{\text{ts}} = f_{\text{MAML}}(\mathcal{D}_i^{\text{tr}}, x^{\text{ts}})$$

Does this structure come at a cost?

For a sufficiently deep f ,

MAML function can approximate any function of $\mathcal{D}_i^{\text{tr}}, x^{\text{ts}}$

Finn & Levine, ICLR 2018

Assumptions:

- nonzero α
- loss function gradient does not lose information about the label
- datapoints in $\mathcal{D}_i^{\text{tr}}$ are unique

Why is this interesting?

MAML has benefit of inductive bias without losing expressive power.

Probabilistic Interpretation of Optimization-Based Inference

Key idea: Acquire ϕ_i through optimization.

Meta-parameters θ serve as a prior. One form of prior knowledge: **initialization** for **fine-tuning**

task-specific parameters

meta-parameters

$$\begin{aligned} \max_{\theta} \log \prod_i p(\mathcal{D}_i | \theta) \\ &= \log \prod_i \int p(\mathcal{D}_i | \phi_i) p(\phi_i | \theta) d\phi_i \quad (\text{empirical Bayes}) \\ &\approx \log \prod_i p(\mathcal{D}_i | \hat{\phi}_i) p(\hat{\phi}_i | \theta) \end{aligned}$$

MAP estimate

How to compute MAP estimate?

Gradient descent with early stopping = MAP inference under
Gaussian prior with mean at initial parameters [Santos '96]

(exact in linear case, approximate in nonlinear case)

MAML approximates hierarchical Bayesian inference. Grant et al. ICLR '18

Optimization-Based Inference

Key idea: Acquire ϕ_i through optimization.

Meta-parameters θ serve as a prior. One form of prior knowledge: **initialization** for **fine-tuning**

Gradient-descent + early stopping (MAML): implicit Gaussian prior $\phi \leftarrow \theta - \alpha \nabla_{\theta} \mathcal{L}(\theta, \mathcal{D}^{\text{tr}})$

Other forms of priors?

Gradient-descent with explicit Gaussian prior $\phi \leftarrow \min_{\phi'} \mathcal{L}(\phi', \mathcal{D}^{\text{tr}}) + \frac{\lambda}{2} \|\theta - \phi'\|^2$
Rajeswaran et al. implicit MAML '19

Bayesian linear regression on learned features Harrison et al. ALPaCA '18

Closed-form or **convex optimization** on learned features

ridge regression, logistic regression

Bertinetto et al. R2-D2 '19

support vector machine

Lee et al. MetaOptNet '19

Current **SOTA** on few-shot image classification

Optimization-Based Inference

Key idea: Acquire ϕ_i through optimization.

Challenges

How to choose architecture that is effective for inner gradient-step?

Idea: Progressive neural architecture search + MAML

(Kim et al. Auto-Meta)

- finds highly non-standard architecture (deep & narrow)
- different from architectures that work well for standard supervised learning

Minilmagenet, 5-way 5-shot	MAML, basic architecture: 63.11%
	MAML + AutoMeta: 74.65%

Optimization-Based Inference

Key idea: Acquire ϕ_i through optimization.

Challenges

Bi-level optimization can exhibit instabilities.

Idea: Automatically learn inner vector learning rate, tune outer learning rate
(Li et al. Meta-SGD, Behl et al. AlphaMAML)

Idea: Optimize only a subset of the parameters in the inner loop
(Zhou et al. DEMML, Zintgraf et al. CAVIA)

Idea: Decouple inner learning rate, BN statistics per-step (Antoniou et al. MAML++)

Idea: Introduce context variables for increased expressive power.
(Finn et al. bias transformation, Zintgraf et al. CAVIA)

Takeaway: a range of simple tricks that can help optimization significantly

Optimization-Based Inference

Key idea: Acquire ϕ_i through optimization.

Challenges

Backpropagating through many inner gradient steps is compute- & memory-intensive.

Idea: [Crudely] approximate $\frac{d\phi_i}{d\theta}$ as identity
(Finn et al. first-order MAML '17, Nichol et al. Reptile '18)

Takeaway: works for simple few-shot problems, but (anecdotally) not for more complex meta-learning problems.

Can we compute the meta-gradient *without differentiating through the optimization path*?

-> whiteboard

Idea: Derive meta-gradient using the implicit function theorem
(Rajeswaran, Finn, Kakade, Levine. Implicit MAML '19)

Optimization-Based Inference

Can we compute the meta-gradient *without differentiating through the optimization path*?

Idea: Derive meta-gradient using the implicit function theorem

(Rajeswaran, Finn, Kakade, Levine. Implicit MAML)

Memory and computation trade-offs

Allows for second-order optimizers in inner loop

Algorithm	5-way 1-shot	5-way 5-shot	20-way 1-shot	20-way 5-shot
MAML [15]	98.7 ± 0.4%	99.9 ± 0.1%	95.8 ± 0.3%	98.9 ± 0.2%
first-order MAML [15]	98.3 ± 0.5%	99.2 ± 0.2%	89.4 ± 0.5%	97.9 ± 0.1%
Reptile [43]	97.68 ± 0.04%	99.48 ± 0.06%	89.43 ± 0.14%	97.12 ± 0.32%
iMAML, GD (ours)	99.16 ± 0.35%	99.67 ± 0.12%	94.46 ± 0.42%	98.69 ± 0.1%
iMAML, Hessian-Free (ours)	99.50 ± 0.26%	99.74 ± 0.11%	96.18 ± 0.36%	99.14 ± 0.1%

A very recent development (NeurIPS '19)
(thus, all the typical caveats with recent work)

Optimization-Based Inference

Key idea: Acquire ϕ_i through optimization.

Takeaways: Construct *bi-level optimization* problem.

- + positive inductive bias at the start of meta-learning
- + consistent procedure, tends to extrapolate better
- + maximally expressive with sufficiently deep network
- + model-agnostic (easy to combine with your favorite architecture)
 - typically requires second-order optimization
 - usually compute and/or memory intensive

Next time:

Wednesday: Applications of meta-learning, multi-task learning to:
imitation learning, generative models, drug discovery, machine translation
student presentations & discussions

Monday: Non-parametric few-shot learners, comparison of approaches
lecture
